#### ■ SPECIFICATIONS

Version	TF	TK	TU	TA
TV standard	PAL B/G	PAL-SECAM B/G-D/K	PAL I/II	PAL B/G-SECAM L/L
Sound system	mono			
Power consumption	14":39W; 20":42W; 21":45W.			
Sound Output Power	2.5W (at 60% mod, 10% THD)			
Speaker	3W 8 ohm			
Teletext system	10 pages memory FASTEXT (FLOF or TOP) version with teletext only			
Aerial input	75 ohm unbalanced			
Channel coverage	off-air cannels, S-cable channels and hyperband			
Tuning system	frequency synthesiser tuning system			
Visual screen size	14": 34 cm 20": 48 cm 21": 51 cm			
Channel indication	On Screen Display			
Program Selection	100 programmes			
Aux. terminal	EURO-SCART : Audio / Video in and Out, R/G/B in, Slow and Fast switching, SVHS in. Audio-Video jack on front of cabinet in common connection with EURO-SCART. Headphone jack (3.5mm) on front of cabinet			
Remote Control Unit	R - 40A01

# SAFETY INSTRUCTION

**WARNING :** Only competent service personnel may carry out work involving the testing or repair of this equipment

## ■ X-RAY RADIATION PRECAUTION

1. Excessive high voltage can produce potentially hazardous X-RAY RADIATION. To avoid such hazards, the high voltage must not exceed the specified limit. The nominal value of the high voltage of this receiver is 22-23 kV (14") or 24-26 kV (20" - 21") at max beam current. The high voltage must not, under any circumstances, exceed 27.5 kV (14", 20"), 29KV (21"). Each time a receiver requires servicing, the high voltage should be checked. It is important to use an accurate and reliable high voltage meter.
2. The only source of X-RAY Radiation in this TV receiver is the picture tube. For continued X-RAY RADIATION protection, the replacement tube must be exactly the same type tube as specified in the parts list.

## ■ SAFETY PRECAUTION

1. Potentials of high voltage are present when this receiver is operating. Operation of the receiver outside the cabinet or with the back cover removed involves a shock hazard from the receiver.
  - 1) Servicing should not be attempted by anyone who is not thoroughly familiar with the precautions necessary when working on high voltage equipment.
  - 2) Discharge the high potential of the picture tube before handling the tube. The picture tube is highly evacuated and if broken, glass fragments will be violently expelled.
2. If any Fuse in this TV receiver is blown, replace it with the FUSE specified in the Replacement Parts List.
3. When replacing a high wattage resistor (oxide metal film resistor) in circuit board, keep the resistor body 10 mm away from the circuit board.
4. Keep wires away from high voltage or high temperature components.
5. This receiver must operate under AC 230 volts, 50 Hz. NEVER connect to a DC supply of any other voltage or frequency.

## ■ PRODUCT SAFETY NOTICE

Many electrical and mechanical parts in this equipment have special safety-related characteristics. These characteristics are often passed unnoticed by a visual inspection and the X-RAY RADIATION protection afforded by them cannot necessarily be obtained by using replacement components rated for higher voltage, wattage, etc. Replacement parts which have these special safety characteristics are identified in this manual and its supplements, electrical components having such features are identified by designated symbol on the parts list. Before replacing any of these components, read the parts list in this manual carefully. The use of substitutes replacement parts which do not have the same safety characteristics as specified in the parts list may create X-RAY Radiation.

## SPECIFICATIONS

### ATSS sorting method

The TV set sweeps all the TV bands from beginning of VHF to the end of UHF. The TV controlling software for each program checks if a VPS CNI code is transmitted. If no VPS CNI code is found, the system checks if a CNI code is transmitted in the teletext lines ( Packet 8/30 format 1 ). If such a code ( VPS or teletext ) is found and if this code is in the ATSS list, the program is automatically named.

The programs found are then sorted into 4 groups :

**Group I** : Contains all the programs from the selected country and named by the TV controlling software. Within this group the sorting order is fixed by the ATSS list.

**Group II** : Contains all the programs with a strong signal strength which are not listed in group I.

**Group III** : Contains all the programs with a weak signal strength which are not listed in group I.

**Group IV** : If two or more programs with the same code are found, only the strongest (or if they have the same level the one with the lowest frequency) is listed in group I, II or III. The others are listed in group IV.

Note : If two programs with the same name but a different code are found these two programs are listed in group I, II or III (e.g. Regional program SW3 in Germany).

The sorting order within group II, III, and IV is based on the channel frequency. The program with the lowest frequency is allocated the first rank in its group, and so forth until the last program of the group which has the highest frequency.

Special case : **Country selection = Others**

#### Note

For TV versions without teletext, and if the controlling software is unable to catch the station name, Group I will remain empty.

**Special case : France**

If France is selected the TV controlling software firstly sweeps all the TV bands with France system selected (positive video modulation) and secondly with Europe system selected (negative video modulation).

**Special case : Switzerland**

If Switzerland is selected the TV controlling software firstly sweeps all the TV bands with Europe system selected (negative video modulation) and secondly with France system selected (positive video modulation).

**Special case : GB**

Note for satellite receiver users : Before starting ATSS turn On your satellite receiver and tune "SKY NEWS ".

If GB is selected the TV controlling software seeks for programs only in UHF ( C21 to C70 ). The sorting order is :

- 1 - BBC1
- 2 - BBC2
- 3 - ITV
- 4 - CH4
- 5 - CH5
- 6 - NEWS

If two or more "identical "programs ( same name but different code e.g. BBC1 and BBC1 Scotland ) are found the following programs in the list will be shifted up. (1 - BBC1, 2 - BBC1, 3 - BBC2, 4 - ITV, 5 - CH4, 6 - CH5, 7 - NEWS, ..)

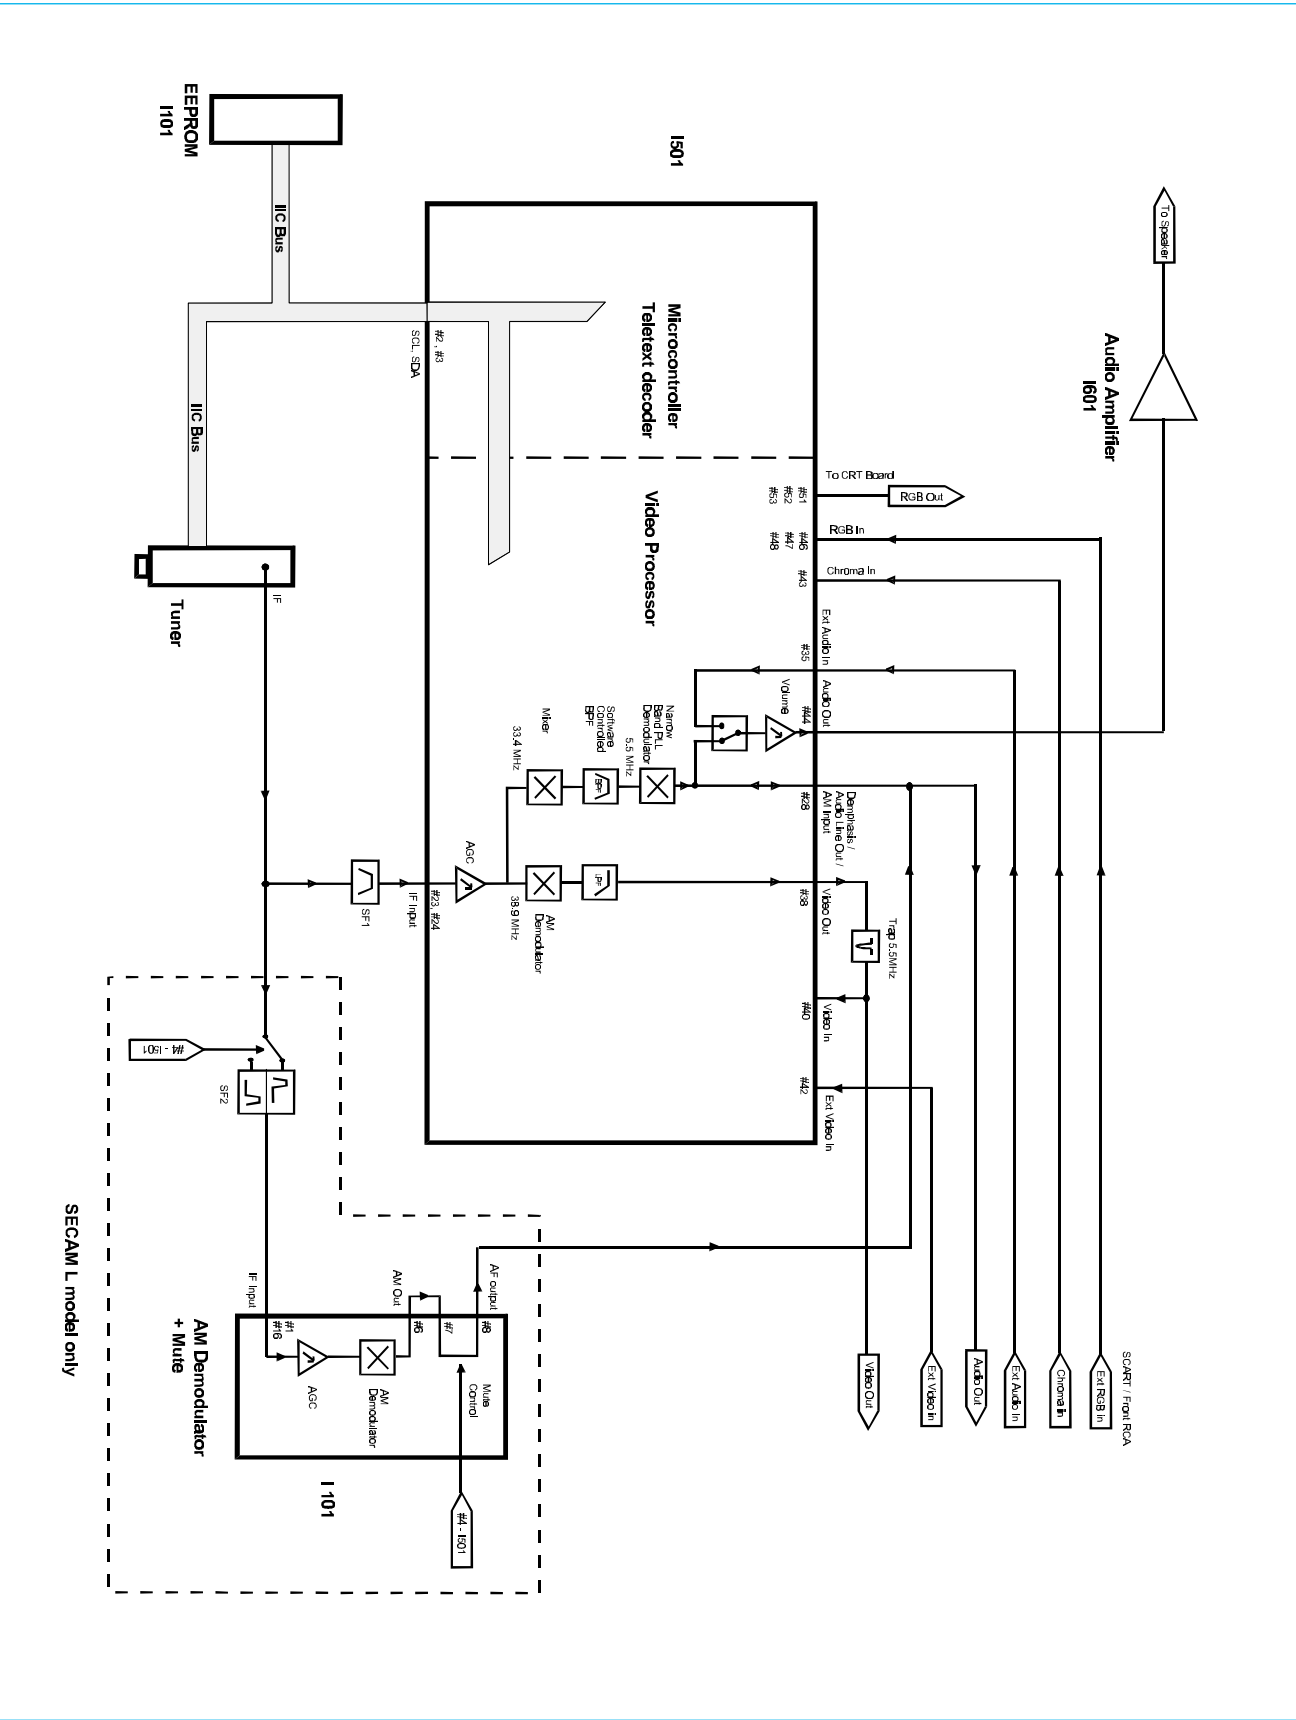

If one of the program above is not found, the associated program number remains empty ( freq.=467.25 MHz - Skip selected - no name – system = GB).

example A : 1 - BBC1, 2 - BBC2, 3 - ITV, 4 - -----, 5 - CH5, 6 - NEWS, ...

example B ( if 2 BBC1 found ) : 1 - BBC1, 2 - BBC1, 3 - BBC2, 4 - ITV, 5 - -----, 6 - CH5, 7 - NEWS, ...

## CIRCUIT BLOCK DIAGRAM

# ALIGNMENT INSTRUCTIONS

## Microcontroller configuration : Service mode

To switch the TV set into service mode please see instruction below.

- 1 - Select pr. number 91
- 2 - Adjust sharpness to minimum and exit all menu.
- 3 - Quickly press the key sequence : **RED - GREEN - menu**

To exit SERVICE menu press **menu** key or **Std By** key.

In Service Mode press "**OK**" to stop the microcontroller i.e. the I2C bus is free and the set can be controlled by external equipment. Press "**OK**" again to allow the microcontroller to control the set again

## Microcontroller configuration :

Tuner Option

Option	Tuner maker
DW	DAEWOO / SAMSUNG
PH1	PHILIPS ( Video processor AGC )
PH2	PHILIPS (tuner internal AGC )

System Option

Option	System
TF	PAL – B/G
TK	PAL – SECAM B/G-D/K
TU	PAL I/I
TA	PAL – SECAM B/G-L/L'

## TV set Alignment

### 1 - G2 alignment

- Set TV in NORMAL I mode
- TV in AV mode without video signal ? Black screen.
- TV preset with WP Red, WP Green and WP Blue equal to 32.
- TV preset with Black R, Black G equal to 8.
- Adjust screen volume ( on FBT ) such that the highest cathode cut-off voltage measured on CRT board, is Vcut-off  $\pm$  5V.

Screen size	Vcut-off
14"	115 V
20" & 21"	125 V

### 2 - White balance

- Select a dark picture and adjust Black G and Black R to the desired colour temperature.
- Select a bright picture and adjust WP Red, WP Green, WP Blue to the desired colour temperature.

## ALIGNMENT INSTRUCTIONS

### 3 - Focus

- Adjust the Focus volume ( on FBT ) to have the best resolution on screen.

### 4 - Vertical geometry

- Adjust the Vertical Amplitude, Shift, S-Correction and Slope to compensate for vertical distortion

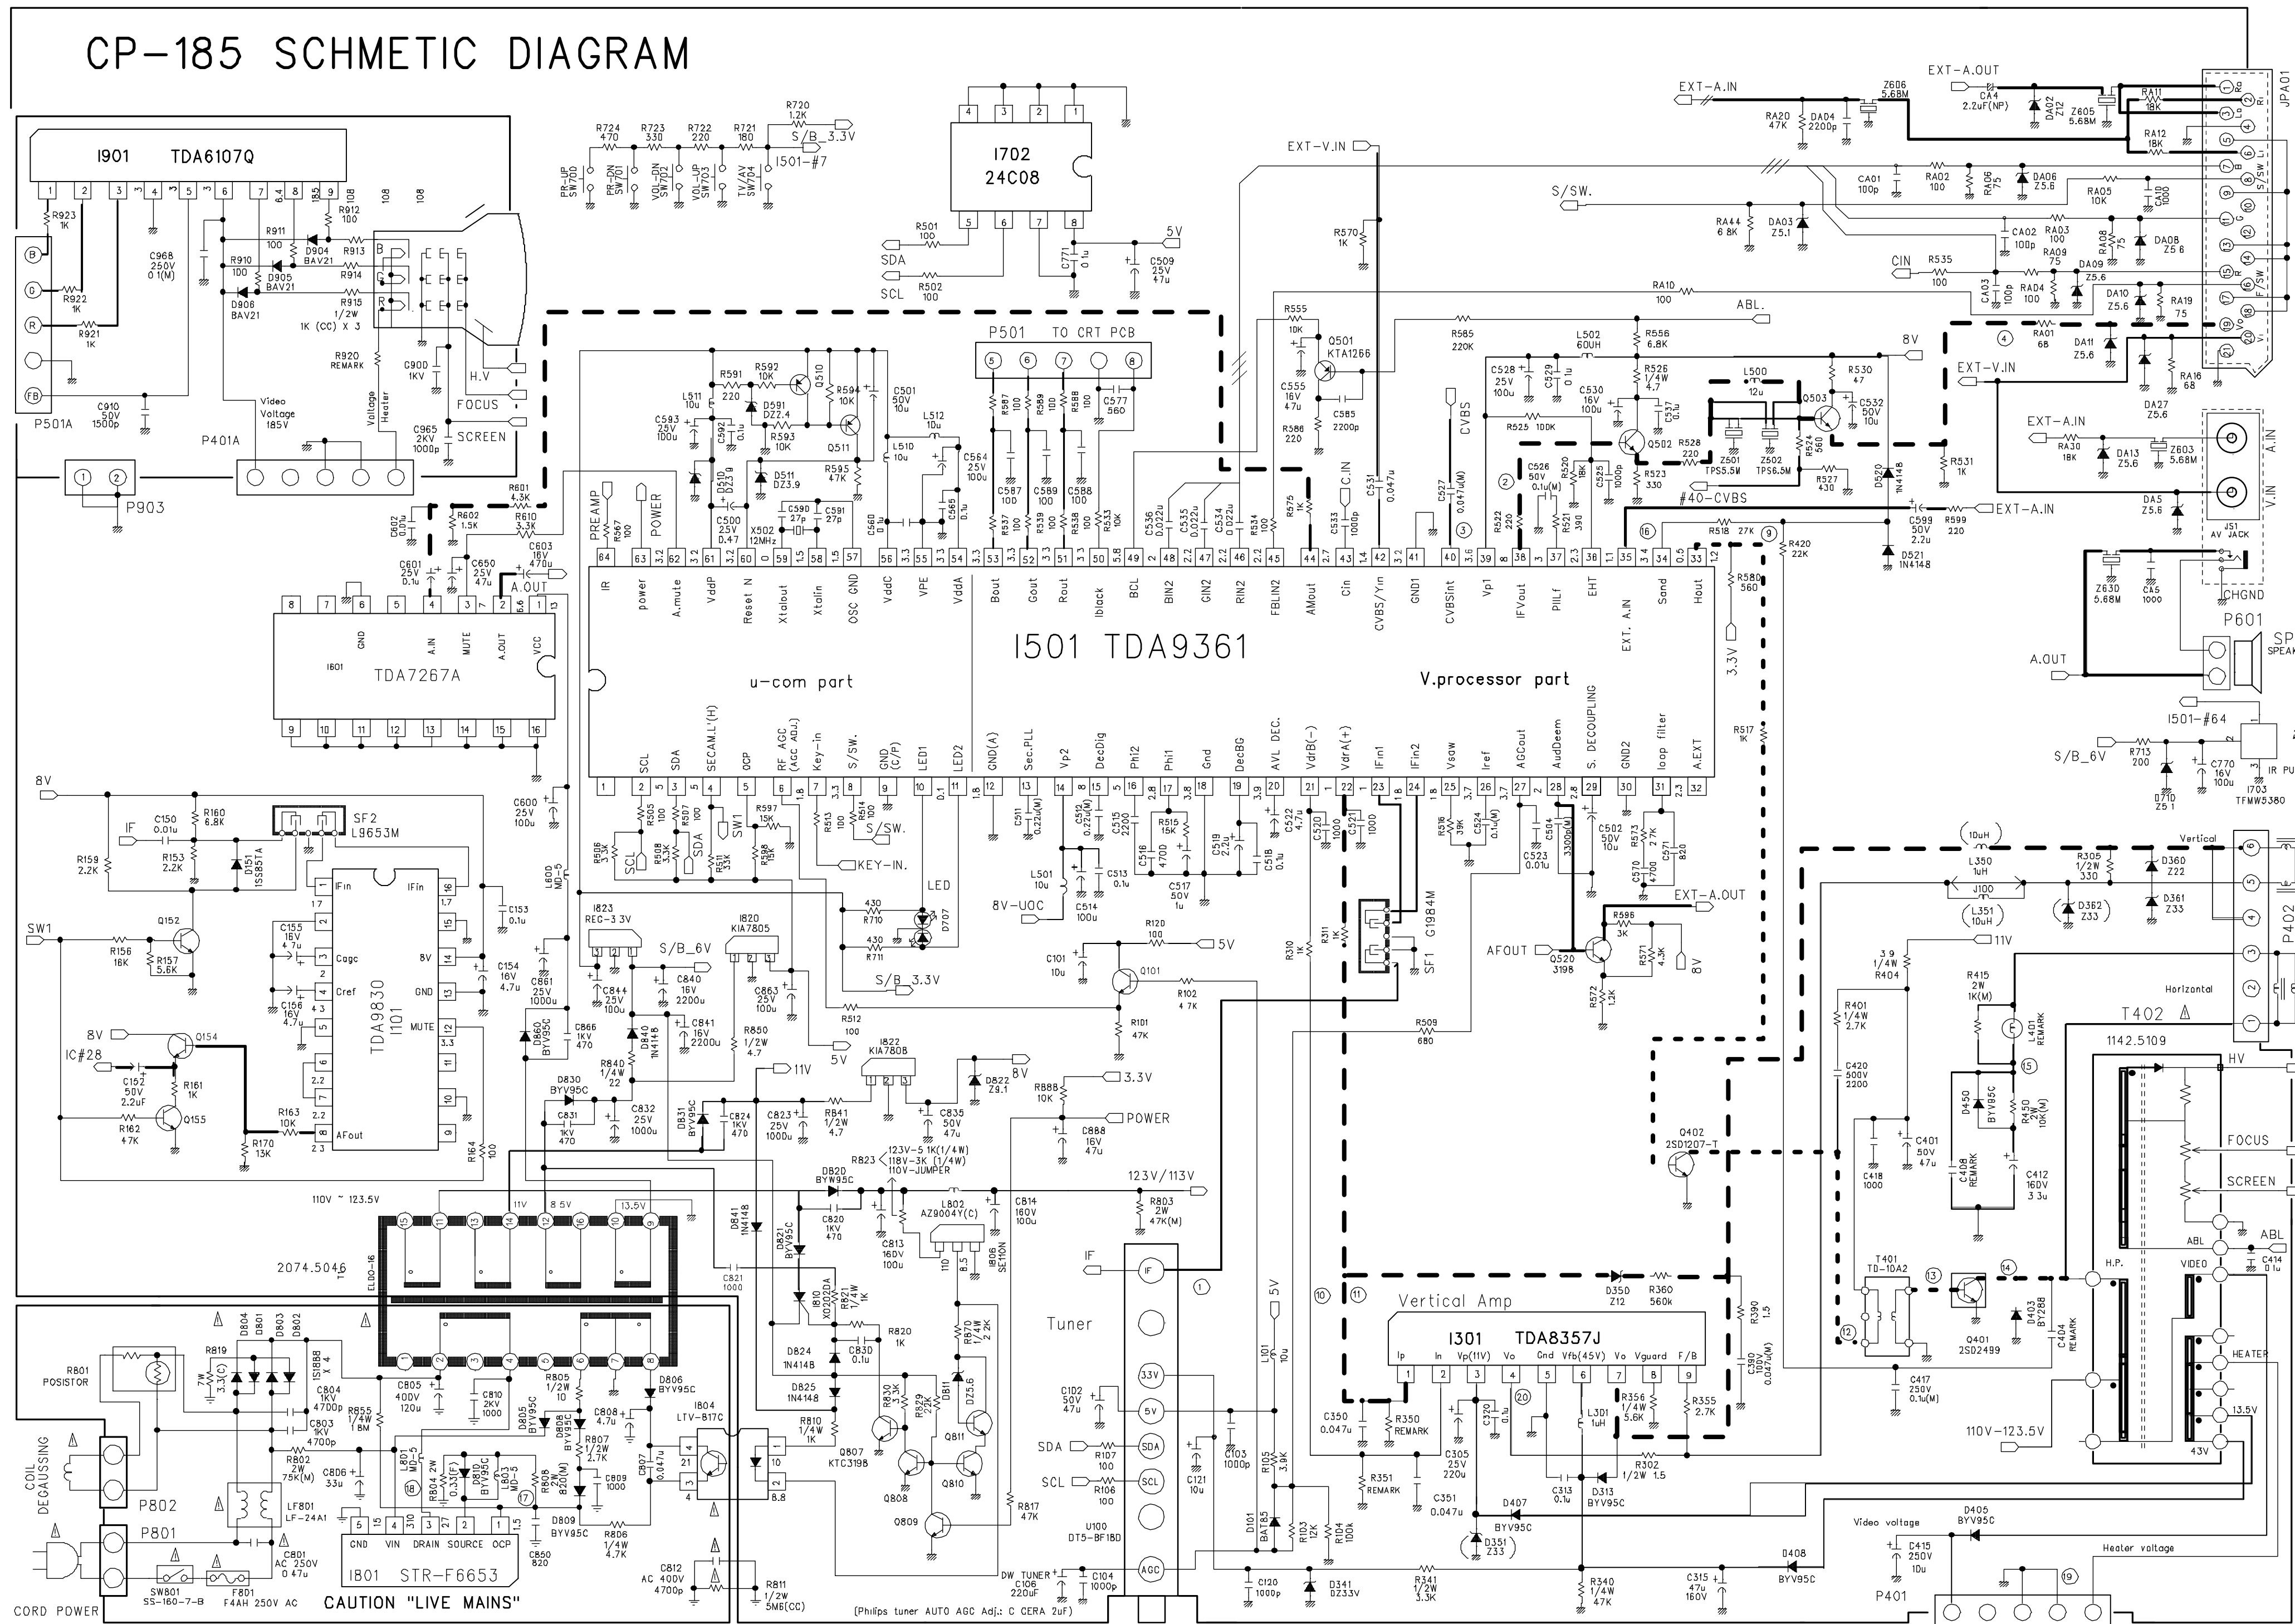

### 5 - Horizontal picture centering

- Adjust H Shift to have the picture in the center of the screen.

### 7 - AGC

- Adjust the antenna signal level to  $70 \text{ dB}\mu\text{V} \pm 2$  for Daewoo tuner ( $63 \text{ dB}\mu\text{V} \pm 1$  for Philips tuner).
- Set RF AGC to 0.
- Increase RF AGC level and stop when the level on pin 6 of I501 goes below 2.5 Vdc

 ..... VIDEO

## NOTE:

1. RESISTANCE IS SHOWN IN OHM. K=1000, M=1000000
2. UNLESS OTHERWISE NOTED IN SCHEMATIC ALL CAPACITOR VALUES ARE EXPRESSED IN  $\mu$ F
3. VOLTAGES READ WITH "VTVM" FROM POINT INDICATED TO CHASSIS GROUND USING A COLOR BAR SIGNAL WITH ALL CONTROLS AT NORMAL LINE 230V AC VOLTAGE READINGS SHOWN ARE NORMAL VALUES AND MAY VARY  $\pm 20\%$  EXCEPT H.V
4. THIS CIRCUIT DIAGRAM IS A STANDARD ONE CIRCUIT PRINTED MAY BE SUBJECT TO CHANGE FOR PRODUCT IMPROVEMENT WITHOUT PRIOR NOTICE

## WARNING:

BEFORE SERVICING THE CHASSIS, READ "X-RAY RADIATION", "SAFETY PRECAUTION", AND "PRODUCT SAFETY NOTICE" IN SERVICE MANUAL

## CAUTION TO SERVICE TECHNICIANS:

BEFORE RETURNING THE RECEIVER TO CUSTOMER, LEAKAGE CURRENT OR RESISTANCE MEASUREMENTS SHOULD BE PERFORMED TO DETERMINE THAT EXPOSED PARTS ARE PROPERLY INSULATED FROM THE SUPPLY CIRCUIT.

## PRODUCT SAFETY NOTE :

THE COMPONENTS MARKED WITH ARE IMPORTANT FOR MAINTAINING THE SAFETY OF THE SET AND SHOULD BE REPLACED ONLY WITH TYPES IDENTICAL TO THOSE IN THE ORIGINAL OR SPECIFIED ONE IN THE PART LIST. DON'T DEGRADE THE SAFETY OF THE SET THROUGH IMPROPER SERVICING.

S/N: 4858904593-00 (JUNE, 2000)

## FUNCTIONAL DESCRIPTION

### FUNCTIONAL DESCRIPTION OF VIDEO PROCESSOR Vision IF amplifier

The vision IF amplifier can demodulate signals with positive and negative modulation. The PLL demodulator is completely alignment-free.

The VCO of the PLL circuit is internal and the frequency is fixed to the required value by using the clock frequency of the  $\mu$ -Controller/Teletext decoder as a reference. The setting of the various frequencies is made by the controlling software in subaddress 27H (33.9 MHz for system L' and 38.9 MHz for all other systems). Because of the internal VCO, the IF circuit has a high immunity to EMC interference.

#### 1. IF demodulator and audio amplifier

The FM demodulator is realised as a narrow band PLL with external loop filter, which provides the necessary selectivity without using an extra band pass filter. To obtain good selectivity a linear phase detector and a constant input signal amplitude are required. For this reason the intercarrier signal is internally supplied to the demodulator via a gain controlled amplifier and AGC circuit. The nominal frequency of the demodulator is set via a gain controlled amplifier and AGC circuit. The nominal frequency of the demodulator is tuned to the required frequency (5.5 / 6.0 / 6.5 MHz) by means of a calibration circuit which uses the clock frequency of the microcontroller as a reference. Selection of the required frequency is done by the controlling software.

#### Video switches

The video switch has one input for an external CVBS or Y/C signal. The selected CVBS signal can be supplied to pin 38, the IF video output. The selection between both signals is realised by the controlling software in subaddress 22H.

The video ident circuit is connected to the selected signal. This ident circuit is independent of the synchronisation.

#### Synchronisation circuit

The IC contains separator circuits for the horizontal and vertical sync pulses and a data-slicing circuit which extracts the digital teletext data from the analogue signal.

The horizontal drive signal is obtained from an internal VCO which is running at a frequency of 25 MHz. This oscillator is stabilised to this frequency by using a 12 MHz signal coming from the reference oscillator of the  $\mu$ -Controller/Teletext decoder.

The horizontal drive is switched on and off via the soft start/stop procedure. This function is realised by means of variation of the TON of the horizontal drive pulses.

The vertical synchronisation is realised by means of a divider circuit. The vertical ramp generator needs an external resistor and capacitor. For the vertical drive a differential output current is available. The outputs are DC coupled to the vertical output stage.

The following geometry parameters can be adjusted:

- Horizontal shift
- Vertical amplitude
- Vertical slope
- S-correction
- Vertical shift

### Chroma and luminance processing

The chroma band-pass and trap circuits (including the SECAM cloche filter) are realised by means of gyrators and are tuned to the right frequency by comparing the tuning frequency with the reference frequency of the colour decoder. The luminance delay line and the delay cells for the peaking circuit are also realised with gyrators. The circuit contains a black stretcher function which corrects the black level for incoming signals which have a difference between the black level and the blanking level.

### Colour decoder

The ICs can decode PAL, NTSC and SECAM signals. The PAL/NTSC decoder does not need external reference crystals but has an internal clock generator which is stabilised to the required frequency by using the 12 MHz clock signal from the reference oscillator of the  $\mu$ -Controller/Teletext decoder.

The Automatic Colour Limiting (ACL) circuit (switchable via the ACL bit in subaddress 20H) prevents oversaturation occurring when signals with a high chroma-to-burst ratio are received. The ACL circuit is designed such that it only reduces the chroma signal and not the burst signal. This has the advantage that the colour sensitivity is not affected by this function.

### SOFTWARE CONTROL

The CPU communicates with the peripheral functions using Special function Registers (SFRS) which are addressed as RAM locations. The registers for the Teletext decoder appear as normal SFRs in the  $\mu$ -Controller memory map and are written to these functions by using a serial bus. This bus is controlled by dedicated hardware which uses a simple handshake system for software synchronisation.

For compatibility reasons and possible re-use of software blocks, the TV processor is controlled by I2C bus. The TV processor control registers cannot be read. Only the status registers can be read ( Read address 8A ).

The SECAM decoder contains an auto-calibrating PLL demodulator which has two references, via the divided 12 MHz reference frequency (obtained from the  $\mu$ -Controller) which is used to tune the PLL to the desired free-running frequency and the bandgap reference to obtain the correct absolute value of the output signal. The VCO of the PLL is calibrated during each vertical blanking period, when the IC is in search or SECAM mode.

The base-band delay line (TDA 4665 function) is integrated. This delay line is also active during NTSC reception, to obtain a good suppression of cross colour effects. The demodulated colour difference signals are internally supplied to the delay line.

## RGB output circuit and black-current stabilisation

In the RGB control circuit the signal is controlled on contrast, brightness and saturation. The ICs have a linear input for external RGB signals. The signals for OSD and text are internally supplied to the control circuit. The output signal has an amplitude of about 2 Volts black-to-white at nominal input signals and nominal settings of the various controls.

To obtain an accurate biasing of the picture tube the 'Continuous Cathode Calibration' system has been included in these ICs. A black level off set can be made with respect to the level which is generated by the black current stabilisation system. In this way different colour temperatures can be obtained for the bright and the dark part of the picture.

The black current stabilisation system checks the output level of the 3 channels and indicates whether the black level of the highest output is in a certain window or below or above this window. This indication is read from the status byte 01 and is used for automatic adjustment of the Vg2 voltage during the production of the TV receiver.

During switch-off of the TV receiver a fixed beam current is generated by the black current control circuit. This current ensures that the picture tube capacitance is discharged. During the switch-off period the vertical deflection is placed in an overscan position so that the discharge is not visible on the screen.

## 2. IF

The TDA9361/TDA9381 has an alignment free IF PLL demodulator. The fully integrated oscillator is automatically calibrated, using the 12 MHz crystal as a frequency reference. The IF frequency is simply set in TV-Processor by I2C bus.

The AFC information is available via I2C bus from the TV-Processor status bytes. The controlling software uses this information for tuner frequency tracking ( automatic following ). The AFC window is typically 125Khz wide. The minimum frequency step of the tuner is 62.5 kHz.

This AFC function is disabled when a program is tuned using the direct frequency entry or after fine tuning adjustment. Therefore it is recommended to tune a channel with the TV search function ( manual or ATSS ) or by using the direct channel entry to enable the Automatic Frequency Control.

## FUNCTIONAL DESCRIPTION

For SECAM L and L' the TDA9361/TDA9381 is switched to positive modulation via I2C bus. SECAM L' transmission only occurs in VHF band I and have their picture and sound carrier interchanged, compared to SECAM L and PAL B/G channels. For SECAM L' the picture carrier is situated at 33.9 MHz and the AM sound carrier at 40.40 MHz. The IF PLL reference is tuned from 38.9 to 33.9 MHz, this is done via I2C Bus and the SIF filter is switched from channel 2 to channel 1; this is done by pin 4 of TDA 9361.

The tuner AGC time constant is slower for positive than for negative modulation, because the TDA9361 reduces its AGC current. To make the AGC time constant even slower an extra series resistor R103 is added. To prevent IF overload when jumping from a very strong transmitter to a weak transmitter a diode D101 has been added

\*\*\*\*\*  
 The SAW filter ( SF1 ) has a double Nyquist slope at 38.9 MHz and 33.9 MHz needed for this multistandard application. The disadvantage of this choice is that a 5.5 MHz trap filter ( Z501 ) is needed to suppress the residual sound carrier in the video for B/G signals.  
 \*\*\*\*\*

### 3. Source switching

#### Video :

The TDA9361/TDA9381 has only one external video input. The SCART video in pin (#20) is connected to the front RCA video input.

The controlling software via I2C bus selects the signal source :

- Video signal from tuner ( Pin 40 ).
- External video.
- External SVHS from SCART.

The sound source switching is done in the video processor part and in the AM demodulator by the  $\mu$ -Controller via I2C bus.

The video processor pin 28 has multiple functions and provides in this application

- Deemphasis time constant
- Audio monitor output
- External AM input
- Deemphasis time constant : The time constant is given by the capacitor C504, needed to obtain the 54 $\mu$ s time constant for standard PAL signal.
- Audio monitor output : the nominal output signal is 500 mVrms, for all standards. The signal is also internally connected through to the audio switch. This signal is not controlled by the volume setting and can be used for SCART audio output.

The signal is buffered to avoid influencing the deemphasis time constant and to adjust the output level.

- External AM input : By software the deemphasis pin can be converted into an input pin. External AM signal for SECAM L/L' is directly connected to this pin. In this configuration the FM sound is internally muted, DC level remains at 3Vdc.

An external sound signal of 500mVrms is applied to pin 35 via a coupling capacitor. The input impedance of this pin is 25K $\Omega$  typical. Switching between internal FM, external AM or external audio from SCART is controlled internally by software.

Fast R, G, B insertion : The external R, G, B insertion needs a fast switching and cannot be controlled by the software ( instruction cycle of  $1\mu$  sec ). The fast switching pin 16 of SCART is directly connected to the TV processor pin 45 ( Fast blanking input ). The display is synchronised with the selected video source, i.e. to get stable R, G, B signal insertion they must be synchronised with the selected video source.

#### 4. $\mu$ -Controller I/O pin configuration and function

The I/O pins of the  $\mu$ -Controller can be configured in many ways. All port functions can be individually programmed by the controlling software.

Each I/O port pin can be individually programmed in these configurations :

##### Open drain

In this mode, the port can function as input and output. It requires an external pull-up resistor. The maximum allowable supply voltage for this pull up resistor is +5V.

So in this mode it is possible to interface a 5 Volt environment like I2C while the  $\mu$ -Controller has a 3.3 Volt supply.

##### Push-Pull

The push pull mode can be used for output only. Both sinking and sourcing is active, which leads to steep slopes. The levels are 0 and Vddp, the supply voltage 3.3Volts.

##### High impedance

This mode can be used for input only operation of the port.

##### Special port for LED

Pin 10 and 11 have the same functionality as the general I/O pins but in addition, their current source and sink capacity is 8 mA instead of 4 mA. These pins are used for driving LED's via a series current limiting resistor.

#### $\mu$ -Controller I/O pin configuration and function table

pin	name	configuration		description
		Stand by	TV ON	
1	n.u.	High impedance	High impedance	not used
2	SCL	Open Drain	Open Drain	Serial clock line
3	SDA	Open Drain	Open Drain	Serial data line
4	SECAM L'	High impedance	Push Pull / High impedance	SIF filter switching + AM/FM switching
5	OCP	High impedance	High impedance	Over Current Protection ( Switch the set OFF if the voltage on this pin is <2.3V )
6	RF AGC in	High impedance	High impedance	Used during ATSS to measure RF signal level.
7	Key in	High impedance	High impedance	Local keyboard input
8	S/SW	High impedance	High impedance	external video switch
10	Red LED	High impedance	Open Drain	
11	Green LED	Open Drain	High impedance	
62	Audio mute	Push Pull	High impedance	

### 5. SECAM L/L' sound switching circuit.

The microcontroller pin 4 is a three levels output. The voltage and configuration of this port is described below :

Sound mode	Port configuration	Voltage
FM	Push Pull	Internally shorted to ground
AM L	Push Pull	Pull up to 3.3V
AM L'	High Impedance	Fixed by R511, R156, R157

In FM mode the microcontroller is internally grounded to pin 4. The TDA9830 output is muted

### 6. Sound amplification

The device TDA7267A is a mono audio amplifier in powerDIP package specially designed for TV application. Thanks to the fully complementary output configuration the device delivers a rail to rail voltage swing without need of bootstrap capacitors. No external heat sink is needed as the Cu ground plane of the PCB is used as heat dissipation.

### 7. Vertical deflection

The vertical driver circuit is a bridge configuration. The deflection coil is connected between the output amplifiers, which are driven in phase opposition. The differential input circuit is voltage driven. The input circuit is especially intended for direct connection to driver circuits which deliver symmetrical current signals, but is also suitable for asymmetrical currents. The output current of these devices is converted to voltages at the input pins via resistors R350 and R351. The differential input voltage is compared with the output current through the deflection coils measured as voltage across R302, which provides internal feedback information. The voltage across R302 is proportional to the output current.

#### Flyback voltage

The flyback voltage is determined by an additional supply voltage  $V_{fb}$ . The principle of operation with two supply voltages (class G) makes it possible to fix the supply voltage  $V_p$  optimum for the scan voltage and the second supply voltage  $V_{fb}$  optimum for the flyback voltage. Using this method, very high efficiency is achieved. The supply voltage  $V_{fb}$  is almost totally available as fly-back voltage across the coil, this being possible due to the absence of a coupling capacitor.

#### Protection

The output circuit has protection circuits for :

- Too high die temperature
- overvoltage of output stage A

#### Guard circuit

The guard signal is not used by the TDA9361/ TDA9381 to blank the screen in case of a fault condition.

#### Damping resistor

For HF loop stability a damping resistor (R305) is connected across the deflection coil.

## 8. Power supply (STR F6653)

### 8-1. STR-F6653 general description

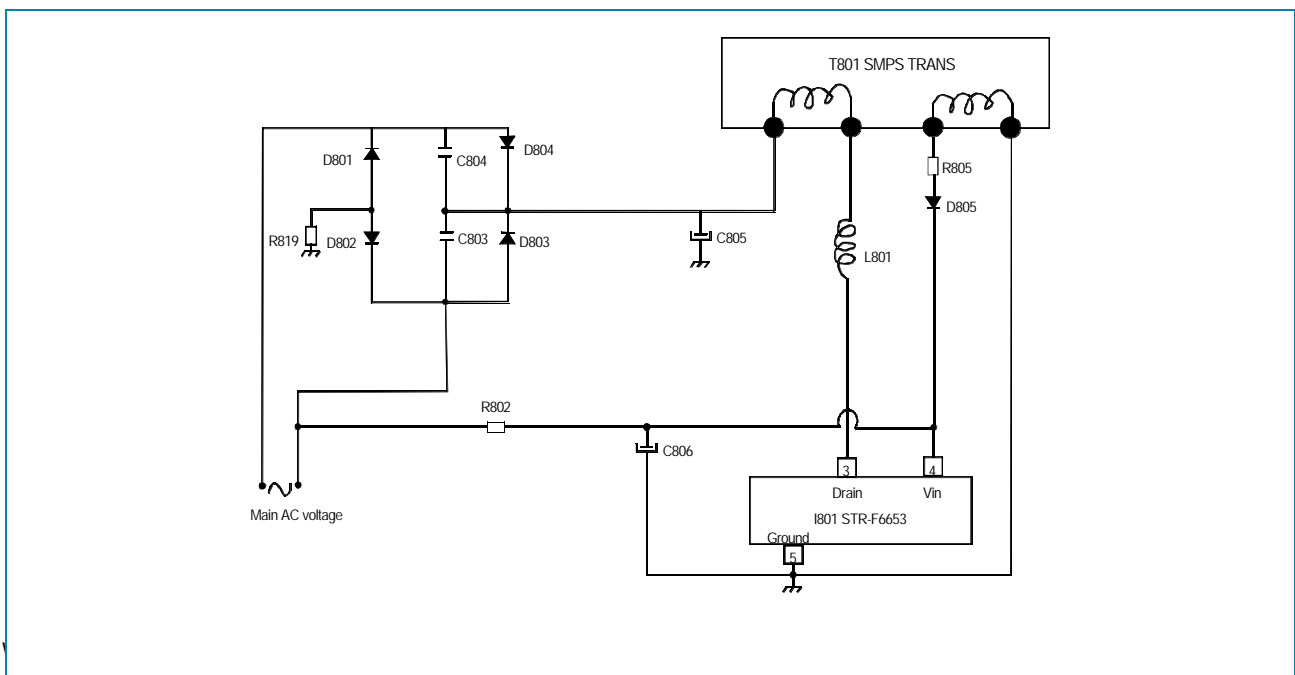

The STR-F6653 is an hybrid IC with a build-in MOSFET and control IC, designed for flyback converter type switch mode power supply applications.

### 8-2. Power supply primary part operations

An oscillator generates pulse signals which turn on and off a MOSFET transistor.

#### 8-2-1. Start-up circuit: $V_{IN}$

The start-up circuit is used to start and stop the operation of the control IC, by detecting a voltage appearing at the  $V_{IN}$  pin (pin 4).

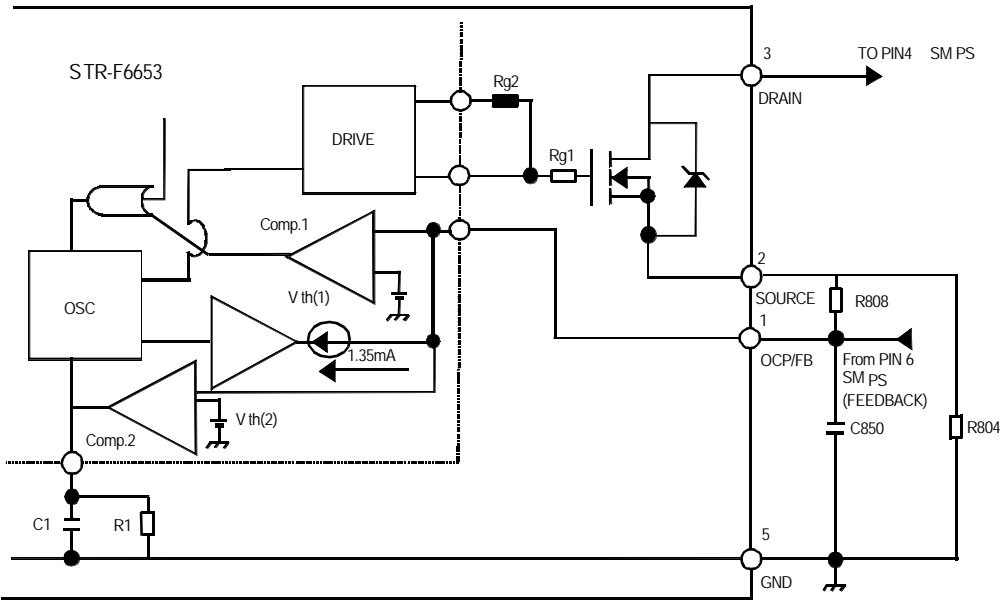

As soon as  $V_{IN}$  reaches 16V, the STR-F6653 control circuit starts operating. Then,  $V_{IN}$  is obtained by smoothing the winding voltage which appears between pin 6 and pin 7 of the SMPS transformer.

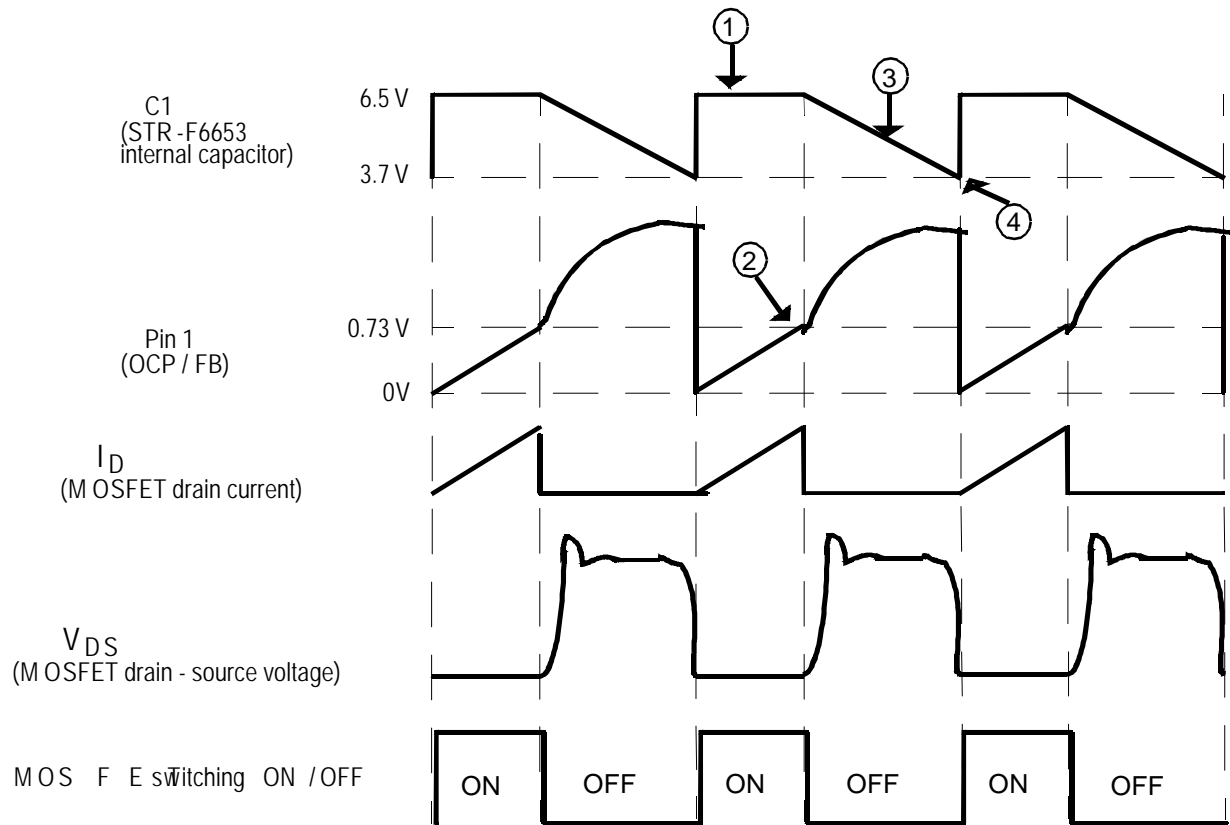

As this winding voltage does not increase to the set voltage immediately after the control circuit starts operating,  $V_{IN}$  starts dropping. However, as this winding voltage reaches the set value before  $V_{IN}$  voltage drops to the shutdown voltage (at 11V), the control circuit continues operating (see below,  $V_{IN}$  voltage at start-up). Resistor R805 prevents variations of voltage at the  $V_{IN}$  pin, as some regulation of the SMPS transformer occurs due to secondary side output current

$V_{IN}$  must be set higher than the shutdown voltage ( $V_{IN}(\text{off}) = 11V_{\text{max}}$ ) and lower than the O.V.P. (overvoltage protection) operating voltage ( $V_{\text{OVP}} = 20.5V_{\text{min}}$ ).

8-2-1. STR-F6653 oscillating operation

Waveforms during oscillating operation

- When the MOSFET is ON, the STR-F6653 internal capacitor C1 is charged at the constant voltage 6.5V. At the same time, the voltage at pin 1 (OCP / FB) increases with the same waveform as the MOSFET drain current.
- When the pin 1 voltage reaches the threshold voltage  $V_{TH1} = 0.73V$ , the STR-F6653 internal comparator 1 starts operating. The STR-F6653 internal oscillator is inverted and the MOSFET turns OFF.
- When the MOSFET turns OFF, charging of STR-F6653 internal capacitor C1 is released and C1 starts discharging by the STR-F6653 internal resistance R1. So, C1 voltage starts falling in accordance to the gradient regulated by the constant discharging time of C1 and R1. So, this means that the fixed time determined by C1 and R1 is the OFF-time of the MOSFET.
- When C1 voltage falls to around 3.7V, the STR-F6653 internal oscillator is reversed again and the MOSFET turns ON. C1 is quickly charged to around 6.5V

The MOSFET continues to oscillate by repeating the above procedure.

### 8-2-3. STR-F6653 protection circuits

overcurrent protection function (OCP)

Overcurrent protection is performed pulse by pulse detecting at STR-F6653 pin 1 (OCP) the peak of the MOSFET drain current in every pulse.

latch circuit

This circuit sustains an output low from the STR-F6653 internal oscillator and stops operation of the power supply when over-voltage protection (OVP) and thermal shutdown (TSD) circuit are in operation

thermal shutdown circuit (TSD)

This circuit triggers the latch circuit when the frame temperature of STR-F6653 IC exceeds 140 °C

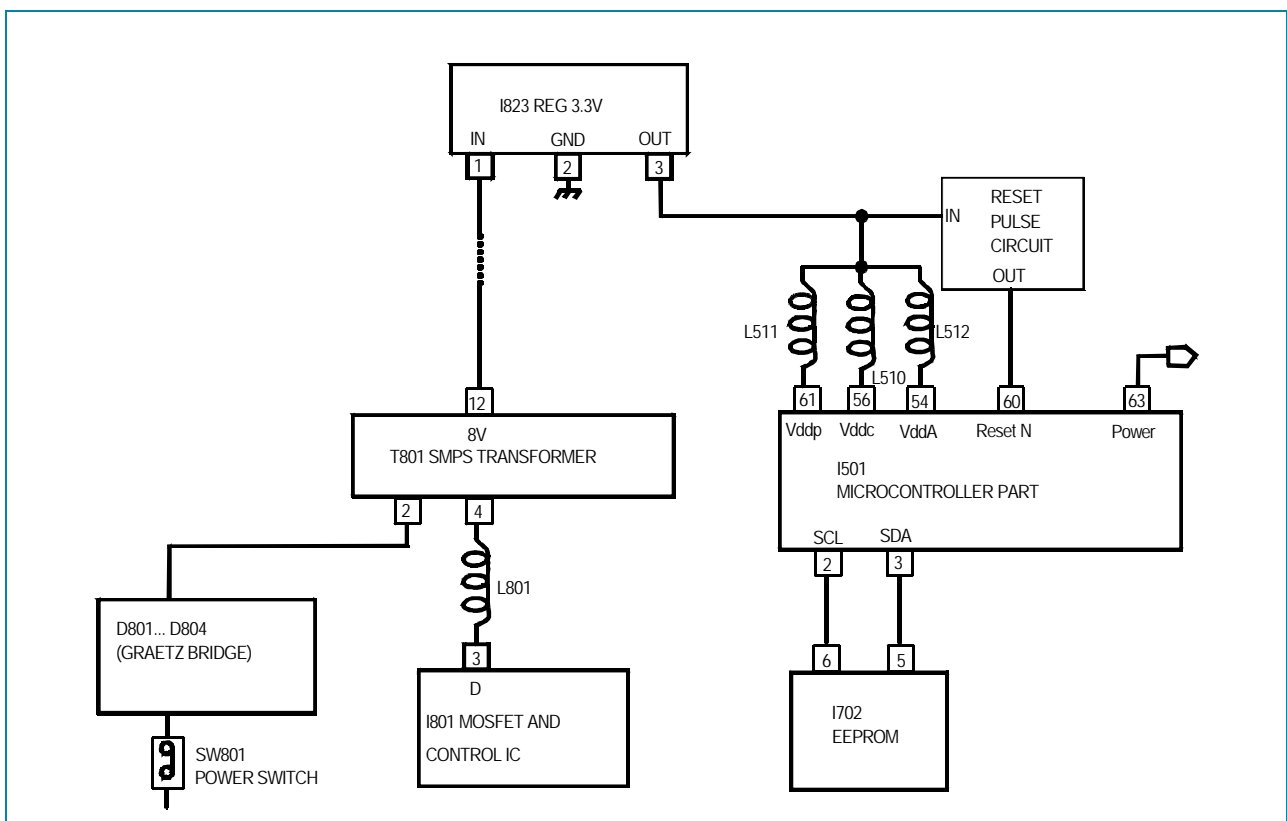

overvoltage protection circuit (OVP)

This circuit triggers the latch circuit when the  $V_{in}$  voltage exceeds 22V (typ.)

## 9. TV start-up, TV normal run and stand by mode operations

### 9-1. TV start-up operations

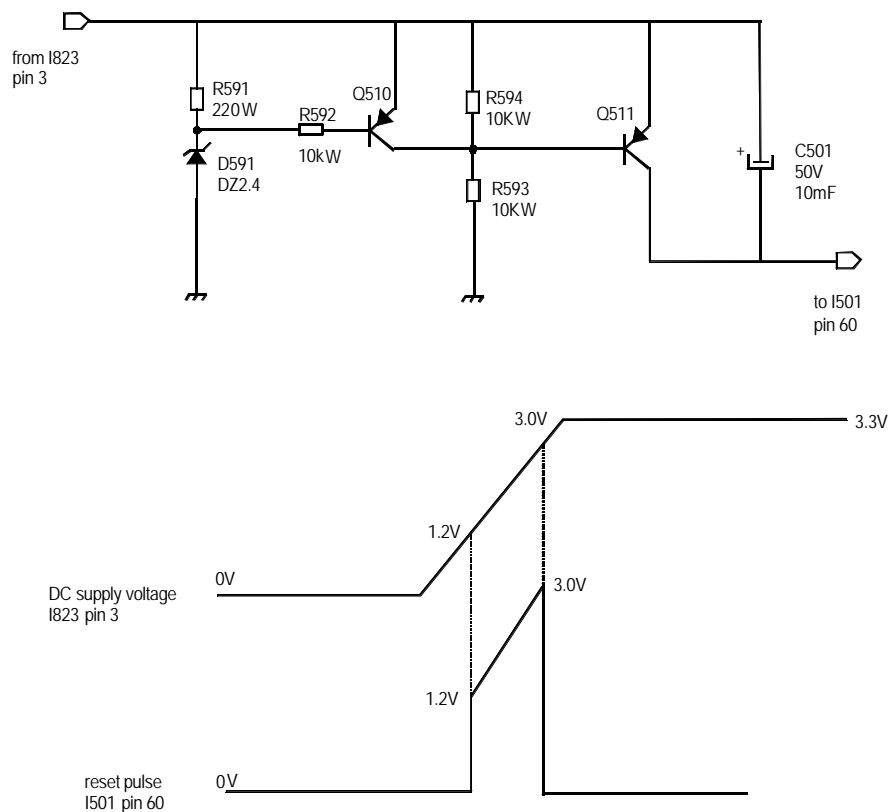

#### 9-1-1. Schematic diagram for start-up operations

### 9-1-2. TV start-up and microcontroller initialisation

- When SW801 power switch is pushed, main AC voltage is applied to T801 transformer (after rectification by D801...D804 diodes). Then, T801 SMPS transformer starts operating and supplies DC voltage to I823 (3.3V regulator).
- This regulator provides 3.3V DC voltage to I501 microcontroller power supply pins (pins 54, 56, 61) and to the reset pulse circuit which provides reset pulse to I501 microcontroller reset pin (pin 60).
- Then, the microcontroller starts its initialisation. Its power pin (pin 63) is set to high which allows delivery of power supply voltages (110/123V, 8V, 5V...). At this step, all IC's start working but no picture appears on screen: I501 IC doesn't provide horizontal drive voltage.
- Then, the microcontroller consults I702 EEPROM via I2C bus to know the last TV set mode (normal run mode or stand-by mode ) before switching off.
- . If the TV set was on normal run mode before switching off, the microcontroller delivers horizontal drive voltage at pin 33 and picture appears on screen.
- . If the TV set was on stand-by mode before switching off, the microcontroller switches TV set to stand-by mode, decreasing power pin voltage (pin 63). This matter will be explained in paragraph 2.2.

### 9-1-3 Reset pulse circuit:

Reset pulse circuit and corresponding waveforms

#### 9-1-4. Reset pulse circuit operations description

- When DC supply voltage from I823 regulator starts rising (from 0V to 1.2V), no current flows through D591 zener diode. So, Q510 is in off mode.

Also  $V_{be\ Q511} = V_{cc}/2 - V_{cc} = -V_{cc}/2 > -0.6V$ . So, Q511 is in off mode.

Then, no voltage reaches I501 pin 60.

- When this voltage reaches 1.2 V, Q510 stays in off mode

but  $V_{be\ Q511} = -0.6V$ . So, Q511 is switched on and starts driving DC supply voltage to I501 pin 60.

- When the DC supply voltage reaches  $(2.4V + 0.6V) = 3.0V$ , Q510 starts conducting but as the Q511 base-emitter voltage is the same as the collector-emitter voltage of the saturated Q510, Q511 switches off and no voltage reaches I501 pin 60.

- If the DC supply voltage decreases below 3 V, Q510 switches off immediately. Q511 starts conducting, pulling I501 pin 60 high. At the same time, it discharges the reset capacitor C501. Discharging this capacitor is necessary to guarantee a defined reset pulse duration.

#### 9-2. TV normal run and stand-by mode operations

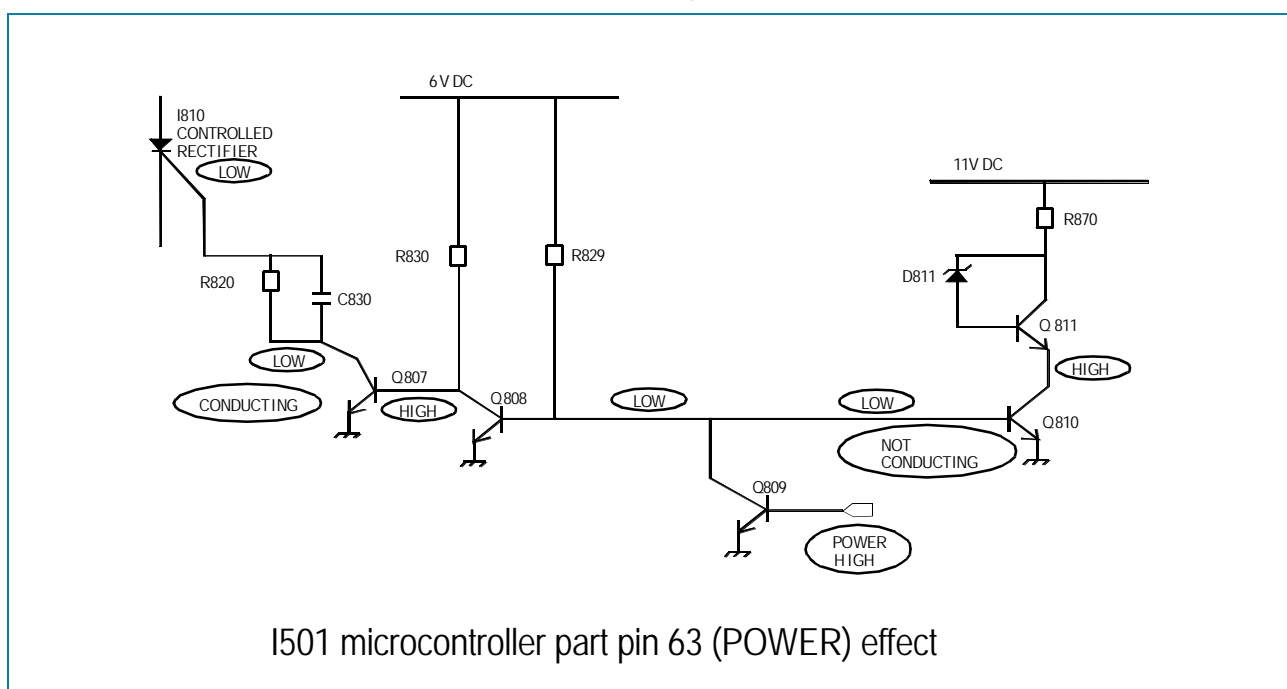

Depending on remote control commands, I501 microcontroller part pin 63 (power) is set to:

- high for normal run mode
- low for stand-by mode

##### 9-2-1. TV on normal run mode

##### 9-2-1-1. I501 microcontroller part pin 63 (power) effect

I501 microcontroller part pin 63 (power) is connected to the following circuit:

In normal run mode, I501 microcontroller pin 63 (power) is set to high

So, I810 controlled rectifier is not conducting

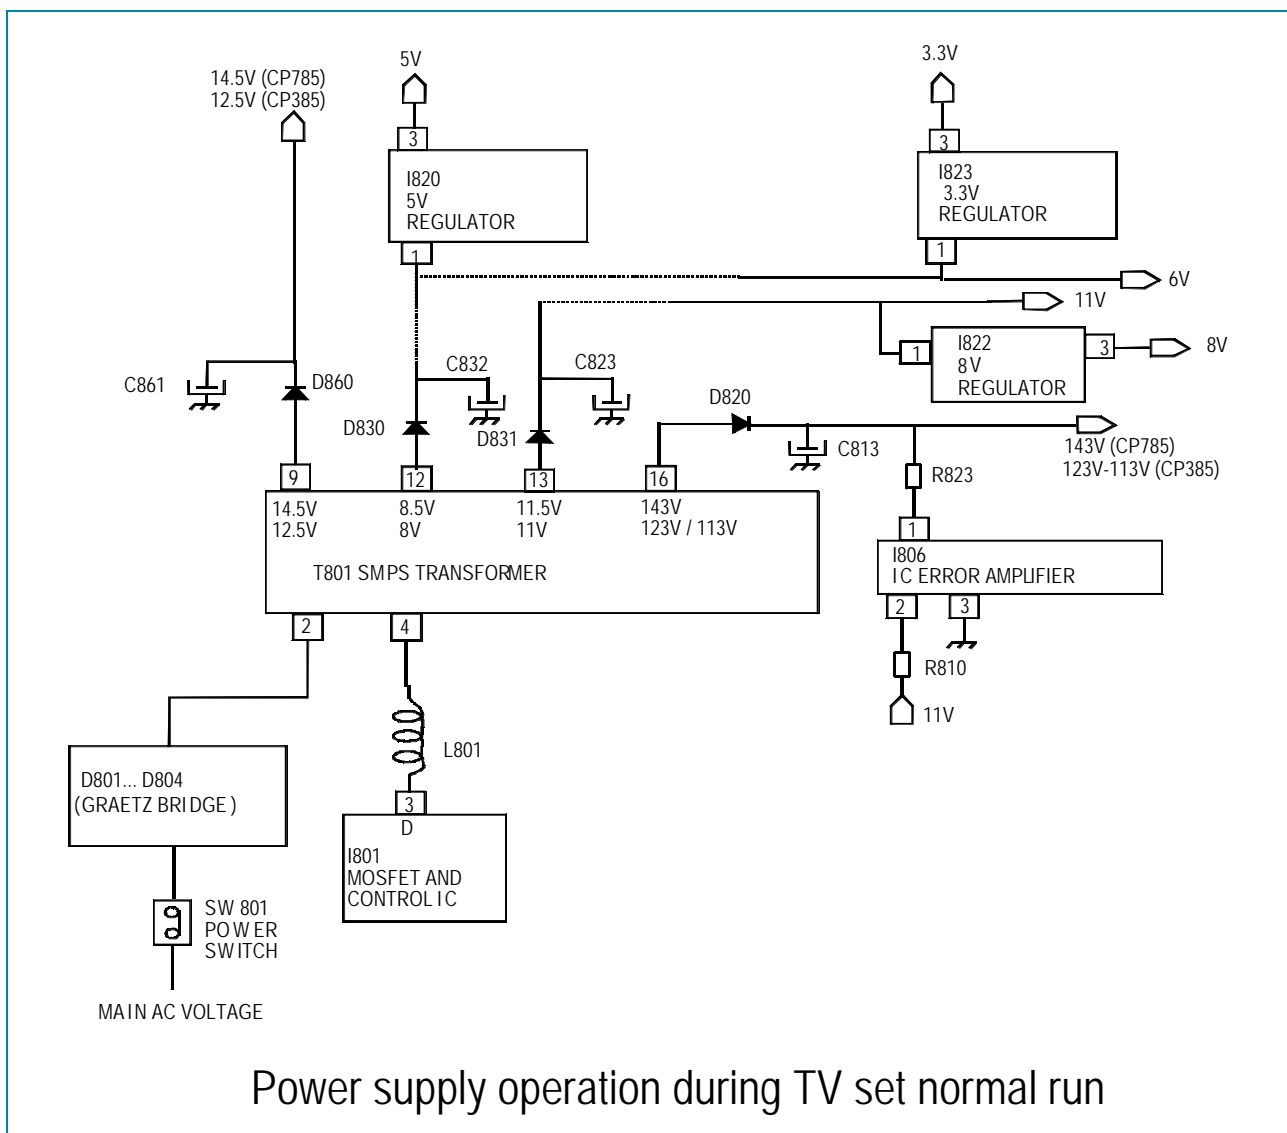

- Q809 is conducting. So, Q808 is not conducting and Q807 is conducting
- So, Q807 collector is connected to the ground and I810 controlled rectifier gate pin is set to low (no conducting)

So, current from 11V DC voltage (from T801 SMPS transformer pin 13) does not flow through Q811 and Q810 transistors but flows through I806 IC error amplifier

- Q809 is conducting. So, Q810 is not conducting and no current flows from Q810 collector to the ground

Therefore, the power circuit diagram is the following one:

### 9-2-1-2. power supply circuit diagram during TV set normal run

- I801 transmits controlled pulses to T801 which generates DC voltages after rectification by secondary side diodes and electrolytic capacitors (for example by D820 and C813 to give 124V -110V supply voltage line).
- 8V, 5V, 3.3V supply voltage lines have stabilised voltages obtained by I822, I820, I823 voltage regulators.
- On 124V-110V supply voltage line, R823 resistor has been chosen to give the exact DC voltage required on this line.
- 124V-110V supply voltage line includes an IC error amplifier (I806) which corrects unexpected DC voltage variations on this line.

power supply line	IC power supply delivery	Remarks
124V-110V	FBT	FBT supplies 45V to I301 vertical IC FBT supplies 14V to I301 vertical IC FBT supplies 33V to the tuner FBT supplies 185V to I901 video amplifier pin 6
13.5V	I601 pin 1	
11V	T401 H- drive	
8V	I501 Main IC pins 14-39	
6V	I703 IR receiver pin 1	
5V	I702 EEPROM pin 8	
	tuner	
3.3V	Main IC $\mu$ com part pins 54-56-61	

#### 9-2-2-1. TV set circuit diagram in stand-by mode

I810 controlled rectifier switching circuit

#### 9-2-2-2. TV set stand-by mode operations

- In stand-by mode, I501 microcontroller pin 63 (power) is set to low.
- So, Q809 collector is set to high.
- Then, I810 controlled rectifier gate pin is set to high and I810 is conducting.
- So, current flows from pin 16 SMPS transformer to the ground via I804 optocoupler and Q810 and Q811 transistors (which are conducting).
- In these conditions, I801 delivers pulses on light mode and T801 produces voltages with reduced power.
- As I810 is conducting, current flows also from pin 16 SMPS transformer to I823 (3.3V regulator) for I501  $\mu$ com, IR receiver and front mask buttons supply voltage (then, remote control or front mask buttons can be activated to leave stand-by mode).

# IC DESCRIPTION

1. TDA9361 : TV signal processor - Teletext decoder with embedded m-Controller.  
TDA9381 : TV signal processor - with embedded m-Controller.

## TV-signal Processor

- Multi-standard vision IF circuit with alignment-free PLL demodulator
- Internal (switchable) time-constant for the IF-AGC circuit
- Mono intercarrier with a selective FM-PLL demodulator which can be switched to the different FM sound frequencies (5.5 / 6.0 / 6.5 MHz)
- Source selection between 'Internal' CVBS and external CVBS or Y/C signals
- Integrated chrominance trap circuit
- Integrated luminance delay line with adjustable delay time
- Asymmetrical 'delay line type' peaking in the luminance channel
- Black stretching for non-standard luminance signals
- Integrated chroma band-pass filter with switchable centre frequency
- Only one reference (12 MHz) crystal required for the  $\mu$ -Controller, Teletext and the colour decoder
- PAL / NTSC or multistandard colour decoder with automatic search system
- Internal base-band delay line
- RGB control circuit with 'Continuous Cathode Calibration', white point and black level off set adjustment so that the colour temperature of the dark and the bright parts of the screen can be chosen independently.
- Linear RGB or YUV input with fast blanking for external RGB/YUV sources. The Text/OSD signals are internally supplied from the  $\mu$ -Controller/Teletext decoder
- Contrast reduction possibility during mixed-mode of OSD and Text signals
- Horizontal synchronisation with two control loops and alignment-free horizontal oscillator
- Vertical count-down circuit
- Vertical driver optimised for DC-coupled vertical output stages
- Horizontal and vertical geometry processing

## m-Controller

- 80C51  $\mu$ -controller core standard instruction set and timing
- 1  $\mu$ s machine cycle
- 64Kx8-bit programmed ROM
- 3 - 12Kx8-bit Auxiliary RAM (shared with Display and Acquisition)
- Interrupt controller for individual enable/disable with two level priority
- Two 16-bit Timer/Counter registers
- watchdog timer
- Auxiliary RAM page pointer
- 16-bit Data pointer
- IDLE and Power Down (PD) mode
- 8-bit A/D converter
- 4 pins which can be programmed as general I/O pin or ADC input.

## Data Capture

- Text memory 10 pages
- Inventory of transmitted Teletext pages stored in the Transmitted Page Table (TPT) and Subtitle Page Table (SPT)
- Data Capture for 525/625 line WST, VPS (PDC system A) and Wide Screen Signalling (WSS) bit decoding Automatic selection between 525 WST/625 WST
- Automatic selection between 625 WST/VPS on line 16 of VBI
- Real-time capture and decoding for WST Teletext in Hardware, to enable optimised  $\mu$ -processor throughput
- Automatic detection of FASTEXT transmission
- Real-time packet 26 engine in Hardware for processing accented, G2 and G3 characters
- Signal quality detector for video and WST/VPS data types
- Comprehensive teletext language coverage
- Full Field and Vertical Blanking Interval (VBI) data capture of WST data

## Display

- Teletext and Enhanced OSD modes
- Features of lever 1.5 WST.
- Serial and Parallel Display Attributes
- Single/Double/Quadruple Width and Height for characters
- Scrolling of display region
- Variable flash rate controlled by software
- Enhanced display features including overlining, underlining and italics
- Soft colours using CLUT with 4096 colour palette
- Globally selectable scan lines per row (9/10/13/16) and character matrix [12x10, 12x13, 12x16 (VxH)]
- Fringing (Shadow) selectable from N-S-E-W direction
- Fringe colour selectable
- Meshing of defined area
- Contrast reduction of defined area
- Cursor
- Special Graphics Characters with two planes, allowing four colours per character
- 32 software redefinable On-Screen display characters
- 4 WST Character sets (GO/G2) in single device (e.g. Latin, Cyrillic, Greek, Arabic)
- G1 Mosaic graphics, Limited G3 Line drawing characters
- WST Character sets and Closed Caption Character set in single device

## Data Capture

The Data Capture section takes in the analogue Composite Video and Blanking Signal (CVBS), and from this extracts the required data, which is then decoded and stored in memory.

The extraction of the data is performed in the digital domain. The first stage is to convert the analogue CVBS signal into a digital form. This is done using an ADC sampling at 12MHz. The data and clock recovery is then performed by a Multi-Rate Video Input Processor (MuVIP). From the recovered data and clock the following data types are extracted WST Teletext (625/525), Closed Caption, VPS, WSS. The extracted data is stored in either memory (DRAM) via the Memory Interface or in SFR locations.

**Data Capture Features**

- Video Signal Quality detector
- Data Capture for 625 line WST
- Data Capture for 525 line WST
- Data Capture for US Closed Caption
- Data Capture for VPS data (PDC system A)
- Data Capture for Wide Screen Signalling (WSS) bit decoding
- Automatic selection between 525 WST/625WST
- Automatic selection between 625WST/VPS on line 16 of VBI
- Real-time capture and decoding for WST Teletext in Hardware, to enable optimised microprocessor throughput
- 10 pages stored On-Chip
- Inventory of transmitted Teletext pages stored in the Transmitted Page Table (TPT) and Subtitle Page Table (SPT)
- Automatic detection of FASTEXT transmission
- Real-time packet 26 engine in Hardware for processing accented, G2 and G3 characters
- Signal quality detector for WST/VPS data types
- Comprehensive Teletext language coverage
- Full Field and Vertical Blanking Interval (VBI) data capture of WST data

## APPENDIX

### IC DESCRIPTION

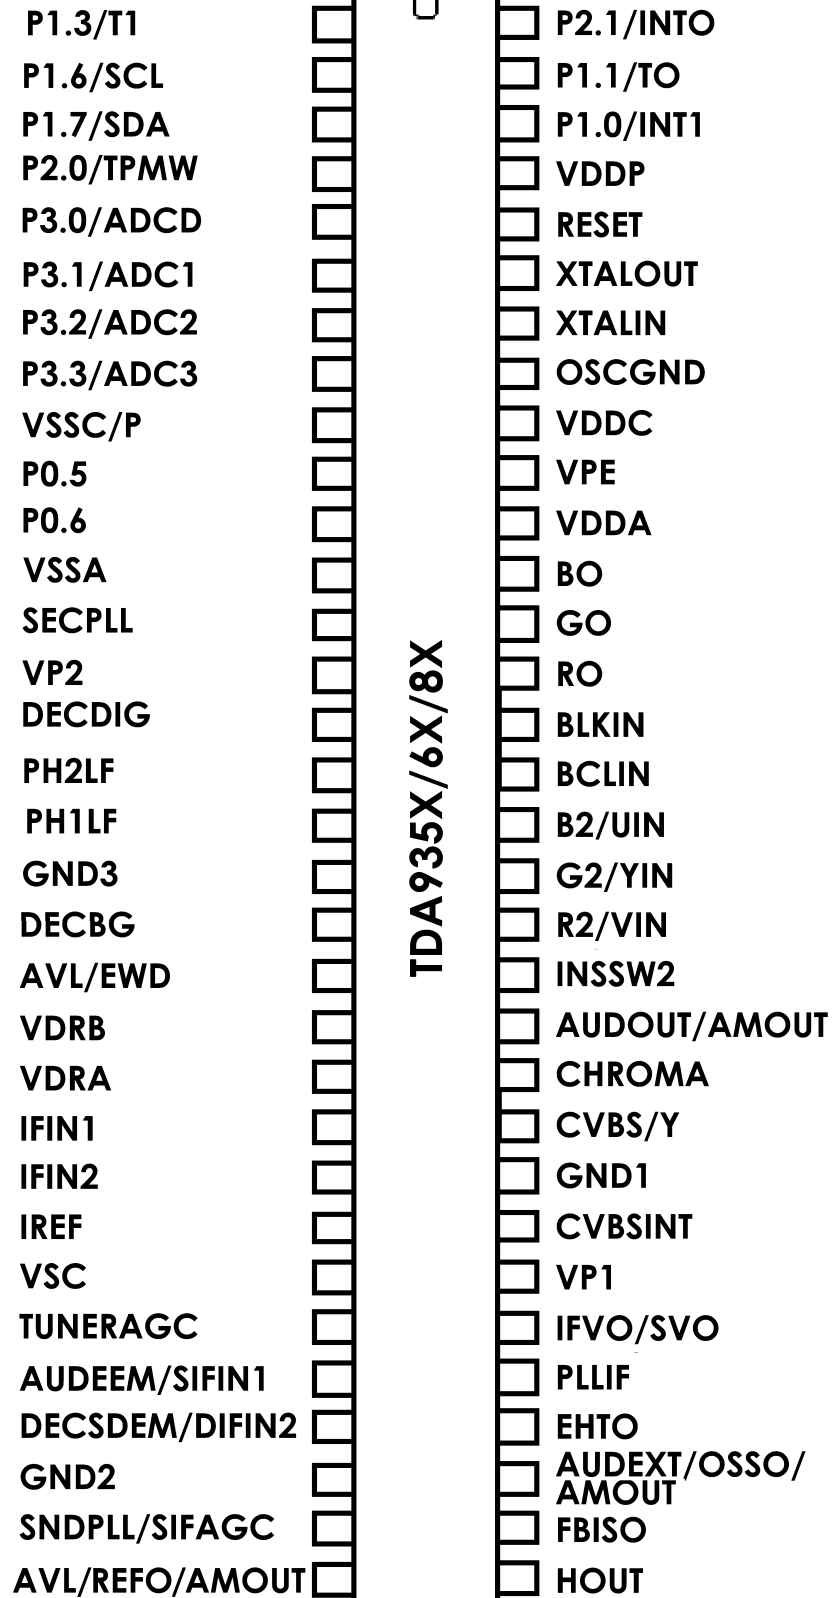

#### IC marking and version

Chassis	IC marking ( line 3 )	OSD languages	Text
CP 185	DW9361/N1/3-DE1 ( note : x is the software version )	English, French, German, Italian, Spanish, Dutch, Danish, Finnish, Norwegian, Swedish, Greek, Hungarian,	English, German, Swedish/Finnish/Hungarian, Italian, French, Portuguese/Spanish, Turkish, Greek
		Polish, Czech, Rumanian	Polish, German, Estonian, Italian, French, Serbian/Croatian/Slovenian, Czech/Slovak, Rumanian
		Russian	Polish, German, Estonian, Russian/Bulgarian, Serbian/Croatian/Slovenian, Czech/Slovak, Rumanian
CP 185	DW9381/N1/3-DE1 ( note : x is the software version )	English, French, German, Italian, Spanish, Dutch, Danish, Finnish, Norwegian, Swedish, Polish, Russian, Hungarian, Czech, Rumanian, Greek	No teletext

#### PINNING

SYMBOL	PIN	DESCRIPTION
n.u.	1	Port 1.3 Not used.
SCL	2	I2C bus clock line
SDA	3	I2C Data line
SECAM L' out	4	Port 2.0 : FM sound : PushPull Low AM SECAM L' : PushPull High AM SECAM L : High Impedance
OCP	5	Port 3.0 : Over Current Protection
RF AGC in	6	ADC 1 : For program sorting in ATSS (High Impedance)
Key-in	7	ADC 2 : local key input ( High impedance )
S/SW	8	ADC 3 : Scart Slow switching input
VssC/P	9	digital ground for $\mu$ -controller core and peripheral
LED 1	10	port 0.5 ( 8mA current sinking capability )
LED 2	11	port 0.6 ( 8mA current sinking capability )
VSSA	12	analog ground of teletext decoder and digital ground of TV processor
SEC PLL	13	SECAM PLL decoupling
VP2	14	2nd supply voltage TV-processor
DECDIG	15	decoupling digital supply of TV-processor
PH2LF	16	phase-2 filter
PH1LF	17	phase-1 filter
GND3	18	ground 3 for TV-processor
DECBG	19	bandgap decoupling
AVL	20	n.u.
VDRB	21	vertical drive B output
VDRA	22	vertical drive A output

IFIN1	23	IF input 1
IFIN2	24	IF input 2
IREF	25	Reference current input
VSC	26	vertical sawtooth capacitor
TUNERAGC	27	tuner AGC output
AUDEEM	28	audio deemphasis
DECSDEM	29	decoupling sound demodulator
GND2	30	ground 2 for TV processor
SNDPLL	31	narrow band PLL filter
SNDIF	32	n.u.
HOUT	33	horizontal output
FBISO	34	flyback input / sandcastle output
AUDEXT	35	external audio input
EHT0	36	EHT/Overvoltage protection
PLLIF	37	IF PLL loop filter
IFVO	38	IF video output
VP1	39	main supply voltage TV-processor
CVBSINT	40	internal CVBS input
GND1	41	ground 1 for TV-processor
CVBS/Y	42	external CVBS/Y input
CHROMA	43	chrominance input (SVHS)
AUDOUT	44	audio out
INSSW2	45	2nd RGB insertion input
R2IN	46	2nd R input
G2IN	47	2nd G input
B2IN	48	2nd B input
BCLIN	49	beam current limiter input
BLKIN	50	black current input
R0	51	RED Output
G0	52	GREEN Output
B0	53	BLUE Output
VDDA	54	analog supply of Teletext decoder and digital supply of TV-Processor (3.3V)
VPE	55	OTP programming supply
VDDC	56	digital supply to core (3.3V)
OSCGND	57	oscillator ground supply
XTALIN	58	crystal oscillator input
XTALOUT	59	crystal oscillator output
RESET	60	reset
VDDP	61	digital supply to periphery (3.3V)
Audio Mute	62	Port 1.0 : Audio mute output (PushPull )
Power	63	Port 1.1 : Power output (PushPull )
IR in	64	Interrupt input 0 : R/C Infrared input

## 2. TDA9830 TV sound AM-Demodulator and audio source switch

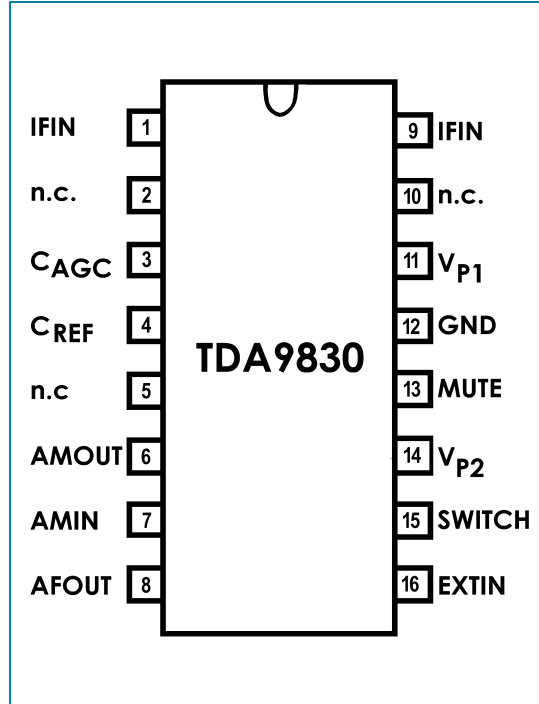

The TDA9830, a monolithic integrated circuit, is designed for AM-sound demodulation used in L and L' standard. The IC provides an audio source selector and also mute switch.

Block Diagram : TDA9830

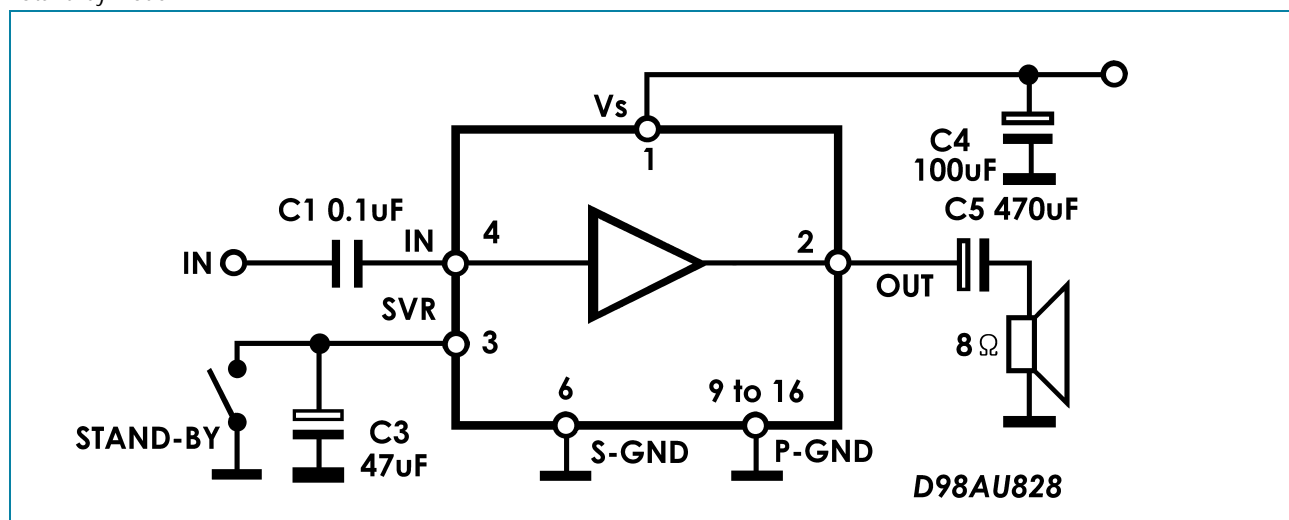

## Pinning

Symbol	Pin	Description
IFIN	1	Sound IF differential input signal
n.c.	2	Not connected
C <sub>AGC</sub>	3	AGC capacitor
C <sub>REF</sub>	4	REF voltage filtering capacitor
n.c.	5	Not connected
AMOUT	6	AM demodulator output
AMIN	7	Input signal from audio switch
AFOUT	8	Output signal from audio switch
EXTIN	9	Input signal (from external) to audio switch
SWITCH	10	Switch input select control
V <sub>P2</sub>	11	Supply voltage +12V (alternative)
MUTE	12	Mute control
GND	13	Ground (0V)
V <sub>P1</sub>	14	Supply voltage +5V to +8V
n.c.	15	Not connected
IFIN	16	Sound IF differential input signal

## 3. TDA7267A - 3W Mono amplifier

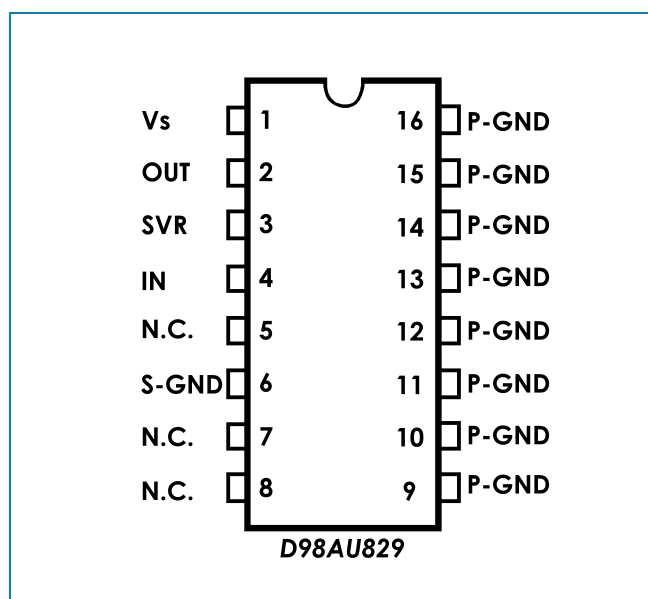

- Can deliver 3W THD 10% 14.5V/8Ω
- Internal fixed gain 32dB
- No feedback capacitor
- No boucherot cell
- Thermal protection
- AC short circuit protection
- SVR capacitor for better ripple rejection
- Low turn ON/OFF pop
- Stand-by mode

Block Diagram

## Pinning

Symbol	Pin	Description
Vcc	1	Supply voltage
OUT	2	Audio output
SVR	3	Supply Voltage Rejection
IN	4	Audio input
n.c.	5	Not Connected
S-GND	6	Signal ground
n.c.	7	Not Connected
n.c.	8	Not Connected
P-GND	9	P Ground
P-GND	10	P Ground
P-GND	11	P Ground
P-GND	12	P Ground
P-GND	13	P Ground
P-GND	14	P Ground
P-GND	15	P Ground
P-GND	16	P Ground

## 4. TDA8357J Vertical Amplifier

The TDA8357J is a power circuit for use in 90° TV systems for field frequencies of 25 to 200Hz and 16/9 picture tubes. The circuit provides a DC driven vertical deflection output circuit, operating as a highly efficient class G system. Due to the full bridge output circuit the deflection coils can be DC coupled.

The IC is constructed in a Low Voltage DMOS process that combines Bipolar, CMOS and DMOS devices. MOS transistors are used in the output stage because of the absence of second breakdown.

Features :

- Few external components
- Highly efficient fully DC-coupled vertical output bridge circuit
- Short rise and fall time of the vertical flyback switch
- Guard circuit
- Temperature (thermal) protection
- High EMC because of common mode inputs

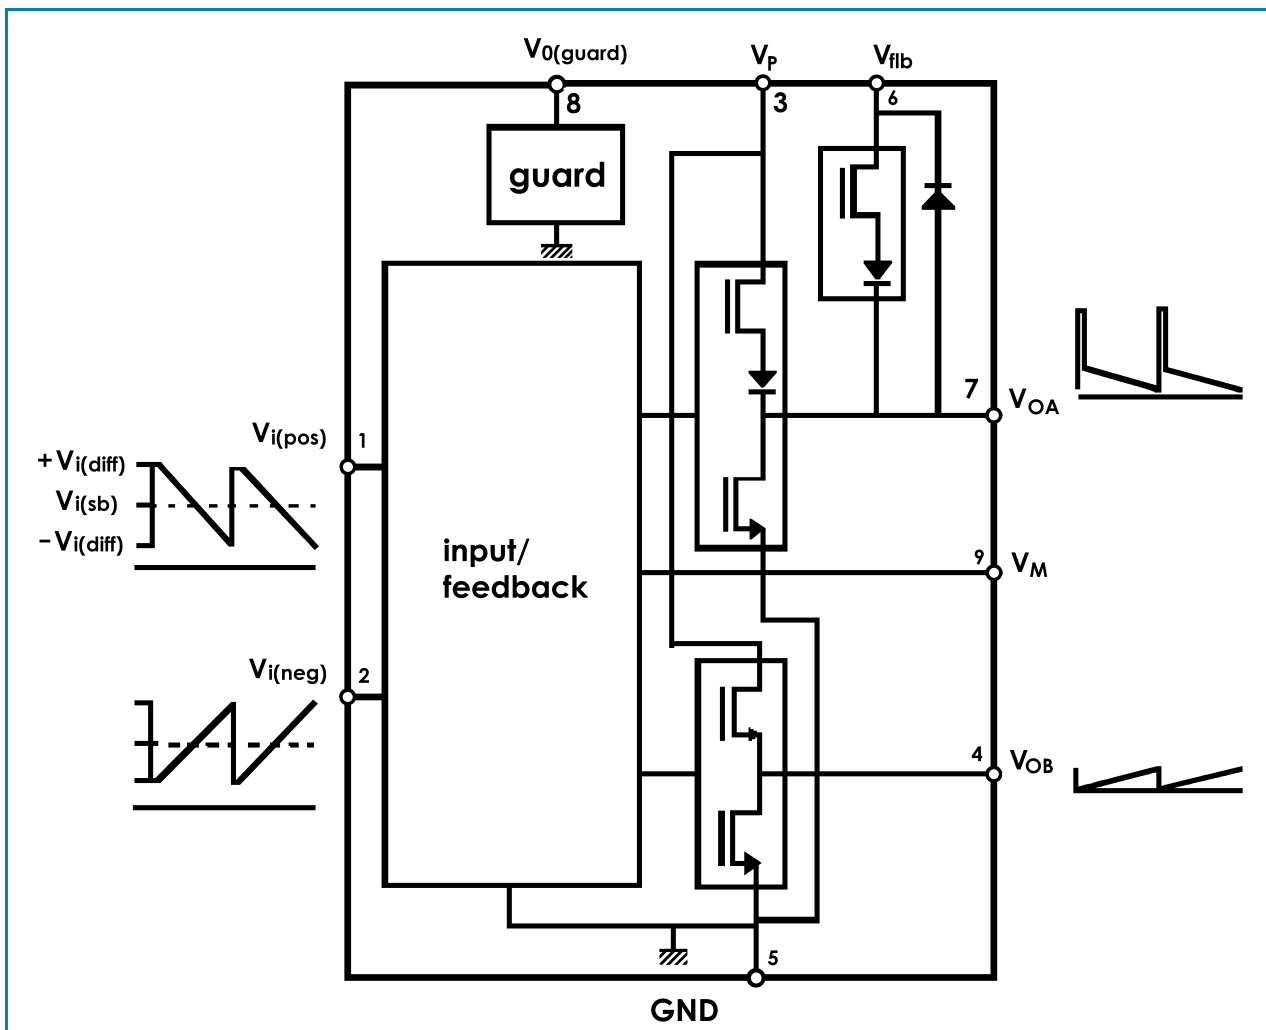

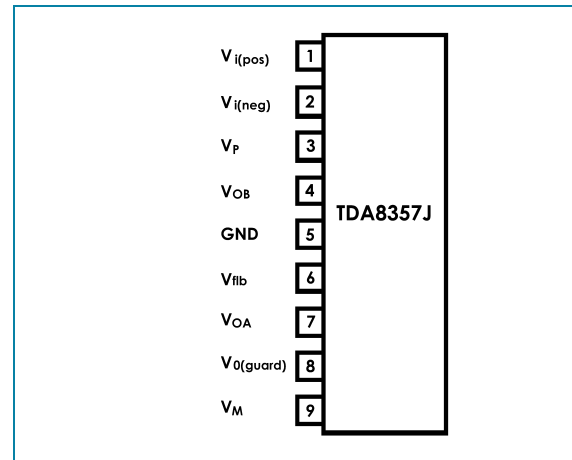

## APPENDIX

### IC DESCRIPTION

#### Pinning

Pin	Symbol	Description
1	$V_{i(pos)}$	input voltage (positive)
2	$V_{i(neg)}$	input voltage (negative)
3	$V_P$	supply voltage
4	$V_{OB}$	output voltage B
5	GND	ground
6	$V_{flb}$	flyback supply voltage
7	$V_{OA}$	output voltage A
8	$V_{O(guard)}$	guard output voltage
9	$V_M$	input measuring resistor

## 5. TDA6107Q

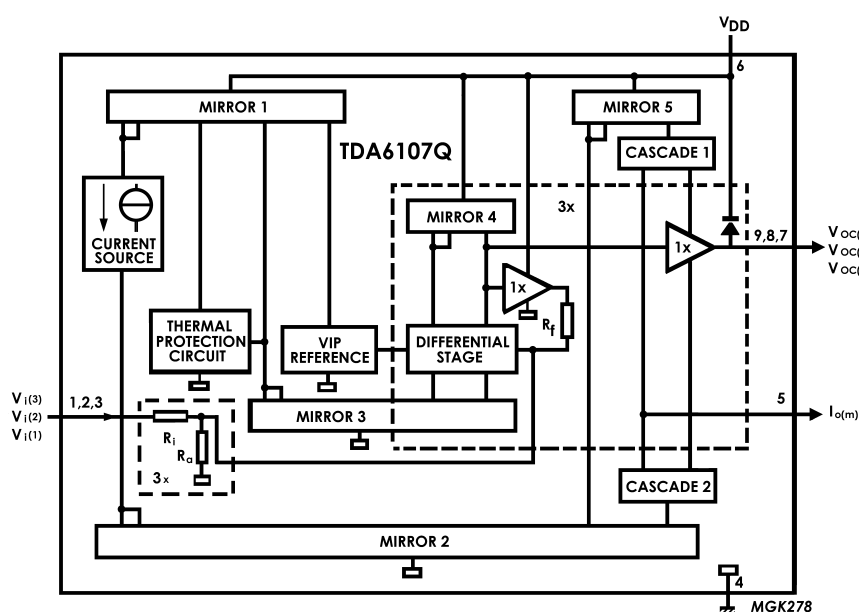

The TDA6107Q includes three video output amplifiers in one plastic DIL-Bent-SIL 9-pin medium power package, using high voltage DMOS technology, and is intended to drive the three cathodes of a colour CRT directly. To obtain maximum performance, the amplifier should be used with black-current control.

### Features

- Typical bandwidth of 5.5 MHz for an output signal of 60 Vpp
- High slew rate of 900V/ $\mu$ s
- No external components required
- Very simple application
- Single supply voltage of 200V
- Internal reference voltage of 2.5 V
- Fixed gain of 50.
- Black-current stabilisation (BCS) circuit
- Thermal protection

### Pin description

Pin	Symbol	Description
1	$V_{i(1)}$	inverting input 1
2	$V_{i(2)}$	inverting input 2
3	$V_{i(3)}$	inverting input 3
4	GND	ground (fin)
5	$I_{om}$	black current measurement output
6	$V_{DD}$	supply voltage
7	$V_{OC(3)}$	cathode output 3
8	$V_{OC(2)}$	cathode output 2
9	$V_{OC(1)}$	cathode output 1

## IC DESCRIPTION

### 6. 24C08 8 Kbit EEPROM

features :

- 8 Kbit serial I2C bus EEPROM
- Single supply voltage : 4.5 V to 5.5 V
- 1 Million Erase/Write cycles (minimum)
- 40 year data retention (minimum)

#### Pin description

Pin No.	Name	Description
1, 2, 3	E0, E1, E2	Device address
5	SDA	Serial Data/Address Input/Output
6	SCL	Serial clock
7	WC	Write control
8	Vcc	Supply voltage
4	Vss	Ground

The memory device is compatible with the I2C memory standard. This is a two wire serial interface that uses a bi-directional data bus and serial clock. The memory carries a built-in 4-bit unique device type identifier code (1010) in accordance with the I2C bus definition.

Serial Clock (SCL)

The SCL input is used to strobe all data in and out of the memory.

Serial Data (SDA)

The SDA pin is bi-directional, and is used to transfer data in or out of the memory

### 7. STR - F6653

#### 7-1. general description

The STR-F6653 is an hybrid IC with a build-in MOSFET and control IC, designed for flyback converter type switch mode power supply applications.

#### 7-2. features

- Small SIP fully isolated moulded 5 pins package
- Many protection functions :
  - Pulse-by-pulse overcurrent protection (OCP)
  - Overvoltage protection with latch mode (OVP)
  - Thermal protection with latch mode (TSD)

The diagram illustrates the internal architecture of the STR-F6600. Key components and their connections include:

- Power Stage:** A MOSFET driver (DRV) with a regulated gate voltage (DRV.REG=8.6V) drives the MOSFET. The MOSFET's source is connected to the OCP/FB pin (1), and its drain is connected to the Drain pin (3). A diode is connected between the Drain and Source pins.
- Control Logic:**
  - Start:** Connected to the Vin pin (4).
  - Reg.:** Connected to the Vin pin (4).
  - T.S.D.:** Thermal Shutdown pin, connected to the Vin pin (4).
  - O.V.P.:** Over Voltage Protection pin, connected to the Vin pin (4).
  - Latch:** Connected to the Vin pin (4) and the OCP/FB pin (1).
  - OSC:** Oscillator block, connected to the Vin pin (4) and the OCP/FB pin (1).
  - OCP/FB comp.:** Over Current Protection / Feedback compensation block, connected to the OCP/FB pin (1) and the Vin pin (4).
  - INH comp.:** Inhibit compensation block, connected to the OCP/FB pin (1) and the Vin pin (4).
- Timing and Compensation:**
  - Vth1=0.73 0.05V:** Threshold voltage for the MOSFET driver.
  - Vth2=1.3~1.6V:** Threshold voltage for the OCP/FB comp. block.
  - 1.35mA:** Current source for the OCP/FB comp. block.
  - Tth(min)=1μs:** Thermal time constant.
  - 4700pF:** Capacitor connected to the Vin pin (4).
  - TOFF=50μs typ.:** Turn-off time constant.
  - Iconst trm:** Constant current trimmer.

PIN	NAME	SYMBOL	DESCRIPTION
1	Overcurrent feedback	O.C. P/E.B.	Input of over current detection signal and feedback signal
2	Source	S	Mosfet source
3	Drain	D	Mosfet drain
4	Supply	V <sub>IN</sub>	Input of power supply for control circuit
5	Ground	GND	Ground
